# Challenge-04

Solving CTF Labs on ThunderCipher

YUVARAJ M

## ThunderCipher – A02-Misconfig Writeup

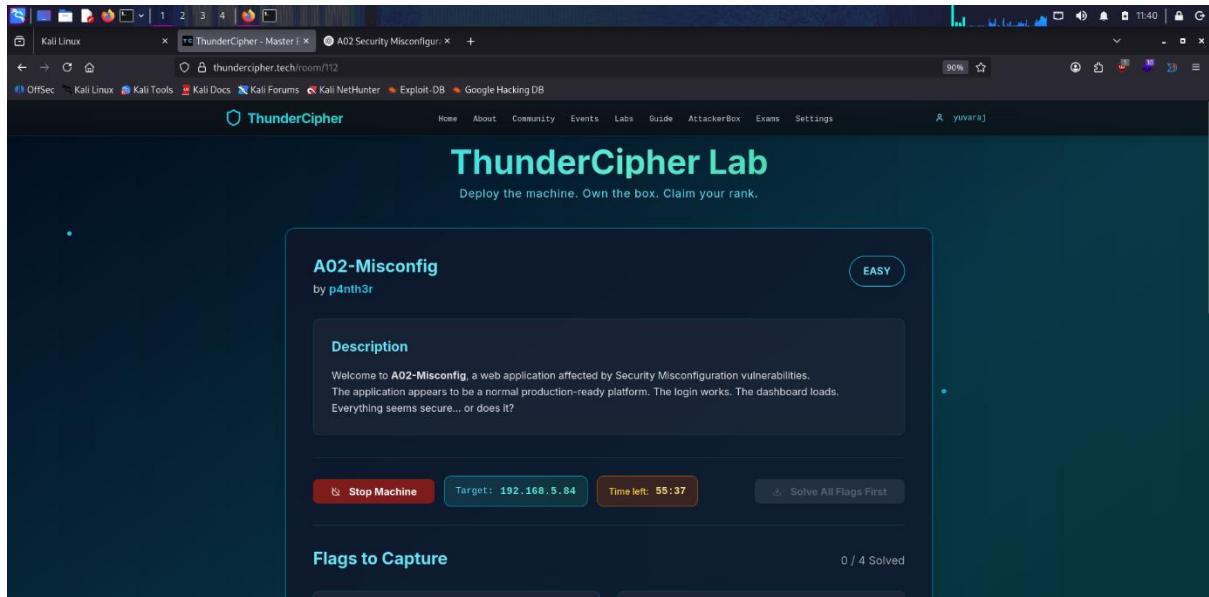

**Difficulty:** Easy

**Category:** Web Exploitation

**Vulnerability:** OWASP A02 – Security Misconfiguration

**Target IP:** 192.168.5.84

**Port:** 80

### Challenge Description

Welcome to A02-Misconfig, a web application affected by Security Misconfiguration vulnerabilities.

The application appears to be a normal production-ready platform. The login works. The dashboard loads. Everything seems secure... or does it?

The objective of this challenge was to enumerate the application and identify security misconfigurations leading to sensitive information disclosure and privilege escalation.

## Methodology

- Port Scanning
  - Service Enumeration
  - Directory Brute Forcing
  - Sensitive File Analysis
  - Source Code Inspection
  - Credential Exploitation
  - Admin Panel Access

## Phase 1 – Port Scanning

## Tool Used: Nmap

**Command Used:** nmap 192.168.5.84 -sV -A

## Explanation:

- **-sV → Service version detection**
  - **-A → OS detection, script scanning, traceroute**

## Results:

## **Open Ports:**

- 22/tcp – SSH
  - 80/tcp – HTTP (Apache 2.4.66 Debian)

**Port 80 was identified as the primary attack surface.**

## Screenshot 1 – Nmap Scan Output

## Phase 2 – Directory Enumeration

**Tool Used: Gobuster**

**Command Used:**

```
gobuster dir -u http://192.168.5.84 \  
-w /usr/share/wordlists/dirb/common.txt \  
-x php,txt,zip,bak,env
```

**Explanation:**

- `dir` → Directory mode
- `-u` → Target URL
- `-w` → Wordlist
- `-x` → File extension brute-forcing

**Extensions searched:**

`php, txt, zip, bak, env`

**Discovered Endpoints**

- `/login.php`
- `/register.php`
- `/.env`
- `/backups`
- `/config.php`

**Critical findings:**

- `/.env`
- `/backups`

## Screenshot 2 – Gobuster Output Showing Discovered Files

## **Phase 3 – Exposed Environment File**

**Accessed:** <http://192.168.5.84/.env>

- The environment file was publicly accessible.

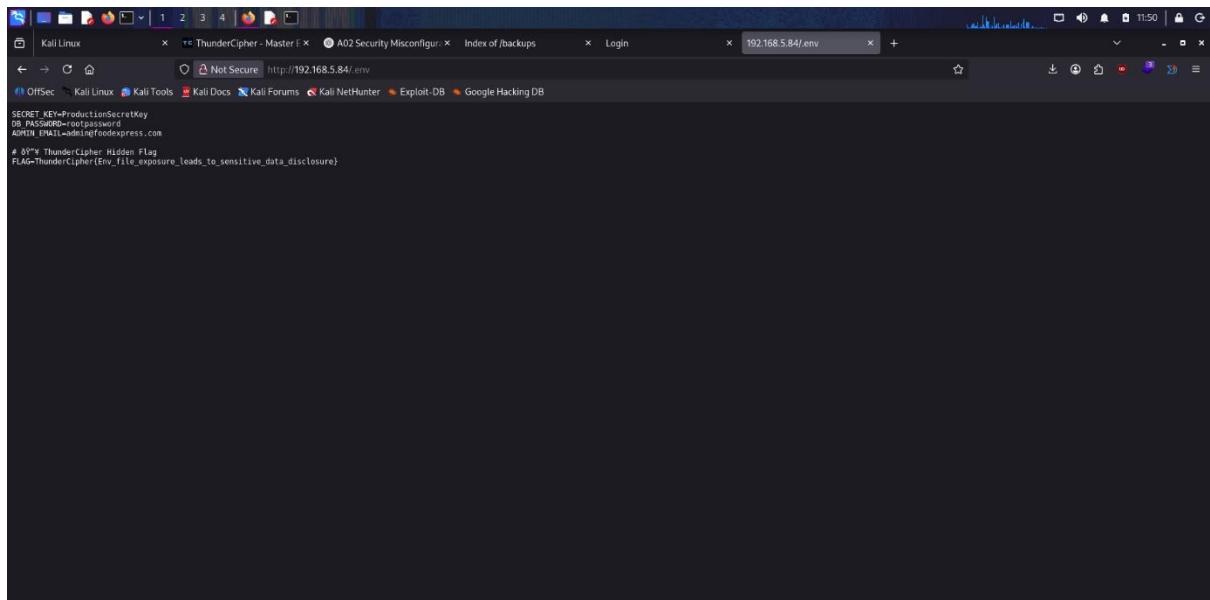

## Sensitive information exposed:

- SECRET\_KEY
  - DB\_PASSWORD
  - ADMIN\_EMAIL
  - FLAG

## Flag 1

**ThunderCipher{Env\_file\_exposure\_leads\_to\_sensitive\_data\_disclosure}**

### Screenshot 3 – .env File Contents with Flag Visible

```
SECRET_KEY=ProductionSecretKey
DB_PASSWORD=root(password)
ADMIN_EMAIL=admin@foodexpress.com
# 0% "ThunderCipher Hidden Flag
FLAG=ThunderCipher{Env_file_exposure_leads_to_sensitive_data_disclosure}
```

### Phase 4 – Backup File Exposure

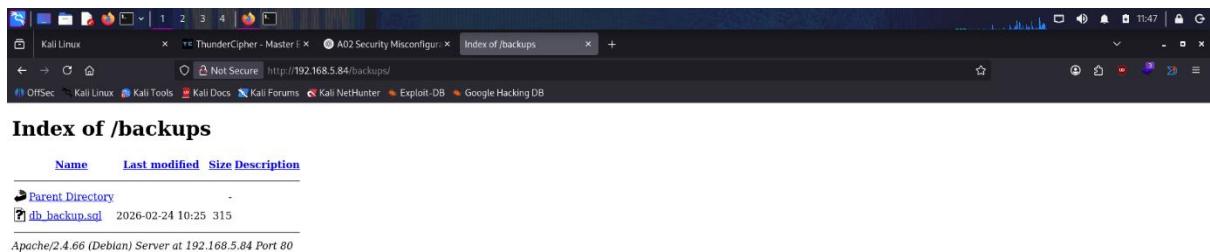

Accessed: <http://192.168.5.84/backups/>

- Backup files were publicly accessible.
- Sensitive internal data was retrieved.

### Flag 2

[ThunderCipher{Backup\\_file\\_exposure\\_leaks\\_sensitive\\_information}](#)

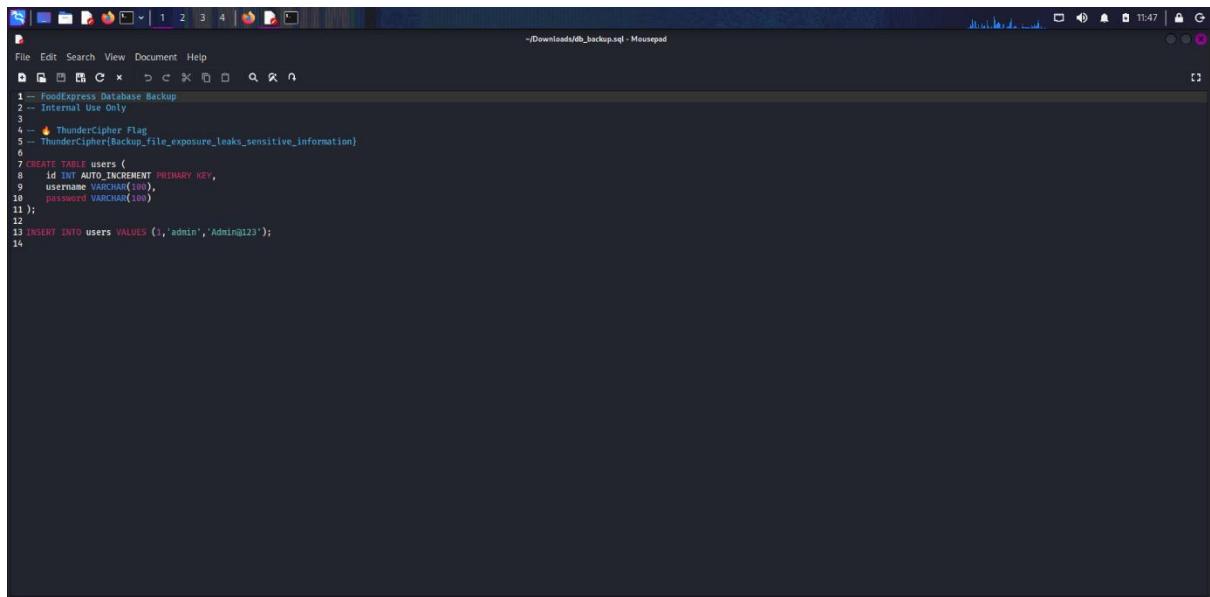

### Screenshot 4 – Backup Directory Listing

Name	Last modified	Size	Description
Parent Directory	-	-	
db_backup.sql	2026-02-24 10:25	315	

Apache/2.4.66 (Debian) Server at 192.168.5.84 Port 80

## Screenshot 5 – Extracted Backup File Showing Flag

```
File Edit Search View Document Help
File Manager x c d f g k l m n o p q r s t u v w x y z
1 -- FoodExpress Database Backup
2 -- Internal Use Only
3
4 -- 🔥 ThunderCipher Flag
5 -- ThunderCipher[Backup_file_exposure_leaks_sensitive_information]
6
7 CREATE TABLE users (
8   id INT AUTO_INCREMENT PRIMARY KEY,
9   username VARCHAR(100),
10  password0 VARCHAR(200)
11 );
12
13 INSERT INTO users VALUES (1,'admin','Admin@123');
14
```

## Phase 5 – Source Code Inspection

- Viewed page source of the application.

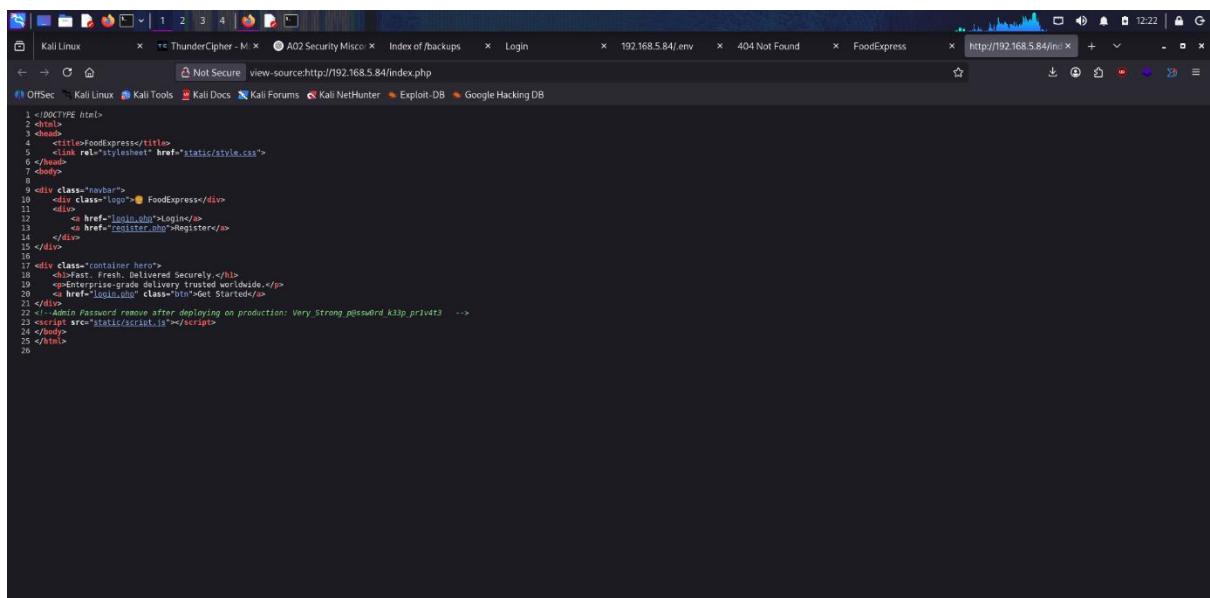

Discovered HTML comment containing admin credentials:

<!--Admin Password remove after deploying on production:

**Very\_Strong\_p@ssw0rd\_k33p\_pr1v4t3-->**

This indicates poor deployment practices.

## Screenshot 6 – Page Source Showing Hardcoded Password

```
File Edit Search View Document Help
File Manager x c d f g k l m n o p q r s t u v w x y z
1 <!DOCTYPE html>
2
3 <head>
4   <title>FoodExpress</title>
5   <link rel="stylesheet" href="static/style.css">
6 </head>
7 <body>
8
9 <div> class="navBar">
10   <div> class="logo"> FoodExpress</div>
11   <div>
12     <a href="login.php">Login</a>
13     <a href="register.php">Register</a>
14   </div>
15 </div>
16
17 <div> class="container home">
18   <h1>Fast, Fresh, Delivered Securely.</h1>
19   <p>Enterprise-grade delivery trusted worldwide.</p>
20   <a href="login.php" class="btn">Get Started</a>
21 </div>
22 <!--Admin Password remove after deploying on production: Very_Strong_p@ssw0rd_k33p_pr1v4t3 -->
23 <script src="static/script.js"></script>
24 </body>
25 </html>
26
```

## Phase 6 – Admin Login

Accessed: <http://192.168.5.84/login.php>

Credentials used:

Username: admin

Password: Very\_Strong\_p@ssw0rd\_k33p\_pr1v4t3

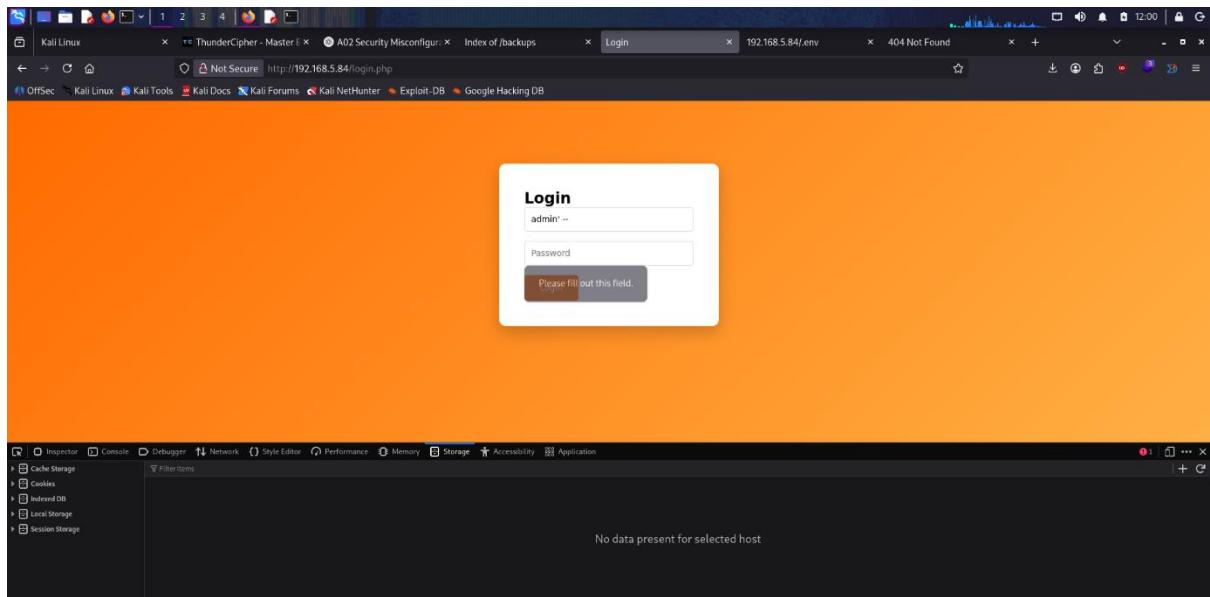

Login successful.

Admin panel revealed final flag.

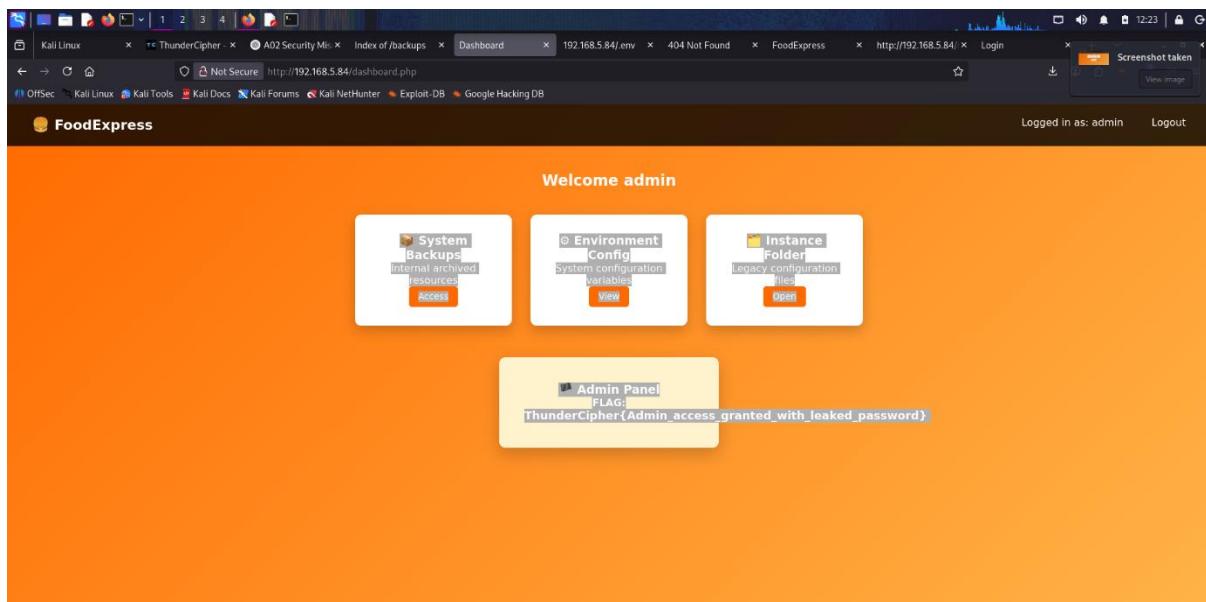

## Final Flag

ThunderCipher{Admin\_access\_granted\_with\_leaked\_password}

## Screenshot 7 – Admin Login Page

## Screenshot 8 – Admin Dashboard with Final Flag

## Vulnerability Analysis

### Vulnerability Type

- OWASP Top 10 – A02: Security Misconfiguration

### Issues Identified

- Publicly accessible .env file
- Exposed backup directory
- Hardcoded credentials in HTML comments
- Sensitive data exposed in production

### Impact

- Credential disclosure
- Database compromise
- Privilege escalation
- Full administrative takeover

In real-world applications, this could lead to:

- Data breach
- System compromise
- Reputation damage

## Remediation

- Block access to sensitive files via web server configuration
- Store .env files outside web root
- Remove backup files from public directories
- Remove debug information before deployment
- Conduct configuration audits before production

## Attack Flow Summary

- Performed Nmap scan → Identified open services
- Used Gobuster → Found hidden endpoints
- Accessed .env → Retrieved Flag 1
- Accessed backups → Retrieved Flag 2
- Inspected source code → Found admin credentials
- Logged in as admin → Retrieved Final Flag

## Final Flags Collected

ThunderCipher{Env\_file\_exposure\_leads\_to\_sensitive\_data\_disclosure}

ThunderCipher{Backup\_file\_exposure\_leaks\_sensitive\_information}

ThunderCipher{Admin\_access\_granted\_with\_leaked\_password}
